

GitHub tutorial for beginner

By Ahmed Nibras

1.

What is GitHub?

git hub is the largest code source in the world

That makes the tools to use git.

so we can say that git is the technology we use and GitHub is the environment
that we use git in.

2.

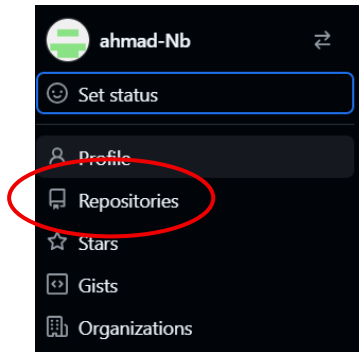

How to use GitHub and git?

1.

To set the environment right make an account on GitHub

2.

after that go to repositories to add your project

Before continuing what is repository

is the file or the area to save project file in GitHub that have all project file like documents photos data set and the main code.

2.1

add new repository chose the name the details and make sure to add read me file

2.2

then create it

2.3

from the green code button take the http link

2.4

3.

let`s download git bash

it`s looks like terminal but we use it to apply git command to our project

now we have account in git hub and git bash to apply the commands

3.1

git clone

With the link we copy from GitHub **repository**

lets say that the project is ready and need to upload it

4.

git add for all files that in the folder

if there a special file use **git add file name**

after upload all files we should save the change on the git hub that we made

so we use

git commit -m

Now you are done

here is some command you can use

git status show current status of your file

git push upload local file to GitHub
